Mathematical problems in fluid dynamics

Mathematical Sciences Research Institute

November 16, 2019

Dear Selection Committee,

I am writing because I would like to be considered for your advertised position of postdoctoral fellow, to begin in the academic year 2020-21.

I am a PhD student at the Massachusetts Institute of Technology, graduating in Spring 2020, and my research is on dispersive partial differential equations and harmonic analysis. A project I am currently working on concerns the modeling of rogue ocean waves via the Dysthe equation. Despite the promising physics literature, even basic properties like local and global well-posedness for the two dimensional equation are unknown, among other interesting questions. I believe that this recent research line fits well within the scope of the program, and I would greatly benefit from taking part in it. Some of my past work has to do with the continuum limit of discrete NLS-type equations, as well as developing a local well-posedness theory for dispersive PDEs with a memory effect. Given our common research interests, I am very excited about the possibility to interact with the strong faculty attending this MSRI program, especially Prof. Alazard and Prof. Kukavica, among others.

A CV and a detailed research statement are included with this application. Moreover, I have asked the following professors to submit a letter of recommendation:

- Luis Vega, Basque Center for Applied Mathematics.
- David Jerison, Massachusetts Institute of Technology.
- Gigliola Staffilani, Massachusetts Institute of Technology (thesis advisor).

Please do not hesitate to contact me should you have any questions. I look forward to hearing from you.

Sincerely,

Ricardo Grande
